

ABSTRACT

A modular fluid power valve assembly having a valve controlling fluid flow from an inlet to an outlet port. The valve can be positioned on a manifold that houses a control assembly used to selectively activate the valve. The control assembly
5 includes a visual indicator to indicate the actuation of the valve. The visual indicator further includes a light source for emitting light. A light pipe is selectively removably attached to the control assembly and valve manifold to allow the light from the light source to be easily seen by the user. The light pipe can be made in a variety of shapes and colors and can be removed by hand for maintenance.
